Arabidopsis thaliana BAC T7B11 from chromosome IV near 9.5 cM

The T7 end of T7B11 is oriented toward the NOR and overlaps with T15B16, GenBank accession number AF104919. The SP6 end of T7B11 is oriented toward the centromere and overlaps with T10M13, GenBank accession number AF001308. There are no discrepancies found in these independently finished overlaps. The region from position 110064 to 110253 exists as single stranded and single chemistry. Incation/Qualifiers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequencing

assimilation, Novel P-PII genes capable of regulating plant nitrogen assimilation, useful for transgenic plant production, and as probes for isolating additional genomic clones having P-PII gene promoters.

Claim 2; Fig 12; 35pp; English.

clones The present sequence encodes a nitrogen regulatory PII protein. Novel plant PII (also called P-PII) nucleotide sequences have been isolated. They are useful for regulating nitrogen assimilation in plants, and in transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PII nucleotides may be used as probes for isolating additional genomic closwith the promoters of P-PII genes. P-PII promoters are light- and/or sucrose-inducible, and are suitable for genetic engineering of plants

```
The invention relates to identifying a stress condition to which a plant cell has been exposed, comprising: (a) contacting nucleic acid representative of expressed polynucleotides in the plant cell with an array or probes representative of the plant cell genome; and (b) detecting a profile of expressed polynucleotides in the plant cell characteristic of a stress response. The method is useful in the production of transgenic plants, cells and seeds and in producing plants with increased tolerance to abiotic stress. The present sequence is that of an Arabidopsis thaliana stress regulated gene (ABZ12196-ABZ17574) used in methods of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             condition to which a plant cell has been exposed increased tolerance to these abiotic stresses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AGTGCCCAAATATCTTCTGATTATTCCAGACTCGAAATTTTACAAGGTGGAAGCAATT

The present sequence encodes a nitrogen regulatory PII protein. Novel plant PII (also called P-PII) nucleotide sequences have been isolated. They are useful for regulating nitrogen assimilation in plants, and in transgenic plant production. They are also used to engineer organisms
                                                                                                                                                                                                                                                                                                            AGTGCCCAAATATCTCTGATTATATTCCAGACTCGAAATTTTACAAGGTGGAAGCAATT AGTGCCAAATATTTCTGAATTATATTCCAGACTCGAAATTTTACAAGGTGGAAGCAATTATATATTTCCAGACTCGAAATTTTACAAGGTGGAAGCAATT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence encodes a nitrogen regulatory PII protein. Novel plant PII (also called P-PII) nucleotide sequences have been isolated. They are useful for regulating nitrogen assimilation in plants, and in transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PII nucleotides may be used as probes for isolating additional genomic clowith the promoters of P-PII genes. P-PII promoters are light- and/or sucrose-inducible, and are suitable for genetic engineering of plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |||||

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CAAATATCTTCTGATTATATTCCAGACTCGAAATTTTACAAGGTGGAAGCAATTGTCAGA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence encodes a nitrogen regulatory PII protein. Novel plant PII (also called P-PII) nucleotide sequences have been isolated. They are useful for regulating nitrogen assimilation in plants, and intransgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PII mucleotides may be used as probes for isolating additional genomic classic the promoters of P-PII genes. P-PII promoters are light- and/or sucrose-inducible, and are suitable for genetic engineering of plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ATTGCTTTCTGATTGCATTTGTTCTGGATTCAGACATTCCCGACCATCTTGC

New Acinetobacter baumanii proteins and nucleic acids, useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, or as biocontrol agents for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to isolated Acinetobacter baumannii nucleic acids The A. baumannii nucleic acids and polypeptides are useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, to detect the presence of A. baumannii and other Acinetobacter species in a sample, in screening compounds for the ability to interfere with the A. baumannii life cycle or to inhibit A. baumannii infection, and as biocontrol agents for plants. The present sequence represents DNA encoding an A. baumannii
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ATTAGTGATGAAATGGTCGACGCGGTAATTGAGTCAATTACACGTGTGGCAAGCACTGGA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     comprising of a combination of 41 nucleic acid molecules (see AAF28514-AAF28554). The library has a number of uses described in the specification e.g. is useful for aidentifying diagnostic and therapeutic compositions. M. catarrhalis (Branhamella catarrhalis) is a large aerobic, gram-negative diplococcus, normally found among the bacterial flora of human upper airways. M. catarrhalis is known to cause acute, localised infections such as otitis media, sinusitis and bronchopulmonary infection and life-threatening, systemic diseases including endocarditis

The present invention describes methods of obtaining immunogenic proteins from Neisseria genomic sequences. AAA81453 to AAA82414 represent specifically claimed Neisseria meninglitidis genomic DNA sequences; AAA81260 to AAA81303 and AAB25620 to AAB25663 represent Neisseria DNA sequences and their corresponding proteins; AAA81254 to AAA81259 and AAA81304 to AAA81301 represent PCR primers used in the isolation of Neisseria meningitidis DNA sequences; and AAA81322 to AAA81452 represent Neisseria meningitidis MenB polymucleotide ORF sequences, which are all used in the exemplification of the present invention. The nucleic acid sequences, protein sequences, and antibodies against them, can be used in the manufacture of a composition. The composition can be used as a medicament for in the manufacture of a medicament) for treating, preventing or diagnosing infection due to Neisserial bacteria. For example, some of the identification of sequences from the bacterium pathogenic Neissariae. Identification of sequences from the bacterium will also facilitate production of biological probes, particularly overcome antigenic variability. The provision of further, complete sequences may provide an opportunity to identify secreted or surface exposed proteins that may be presumed targets for the immune system and which are not antigenically variable or at least more conserved than other more

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         06-NOV-2003
An Arabidopsis full-length cDNA library was constructed essentially as reported previously (Seki et al., 1998).cDNA cleaved with BamHI and XhoI was ligated to modified Lambda FLC-1 vector (Carninci et al., submitted for publication) digested with BamHI and SalI. This clone is in a modified pBluescript vector. Please visit our web site (http://www.gsc.riken.go.jp/e/plant/index _e.html) for further
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         536

/note="Vector: pSPCNT1; Site 1: SalI; Site 2: NotI; cDNA
library from Arabidopsis thaTiana, accession Landsberg
erecta; six weeks old total plants were treated for 24
hours with different stresses, (1) at 4M-0 C in the dark,
(2), at 37 Grad C in the dark, (3) lying in the lab after
removing from soil, (4) in the greenhouse after wounding
leaves with a foreceps, (5) in the lab watering with a 150
mM Nacl solution, (6) at 26 Grad C in the light/UV; equal
quantities of stressed plant material were pooled; library
was made at the Max-Planck-Institute for Plant Breeding
Research, Cologne, Germany; cloning sites SalI-NotI,
primer sites and orientation:
T7-SalI-CCACGCGTCG-Sprime-CDNA-polyA-CC-NotI-SP6; Note:
Sequencing granted in the context of the GABI Arabidopsis
Verbund I: Genetic Diversity, 'Establishment of
high-efficiency SNP-based mapping tools and development of
methods for genome-wide mutation detection' PI: Bernd
Weisshaar Sequence submission managed by RZPD/GABI-Primary

An Arabidopsis full-length cDNA library was constructed essentially as reported previously (Seki et al., 1998).cDNA cleaved with BamHI and Xhol was ligated to modified Lambda Fic.1 vector (Carninci et al., submitted for publication) digested with BamHI and Sali. This clone is in a modified pBluescript vector. Please visit our web site (http://www.gsc.riken.go.jp/e/plant/index_e.html) for further details.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             bp mRNA linear EST 23-APR-2002 thaliana cDNA clone RAFL14-63-K15 3',

XhoI; Immature seeds, collected from pods ranging in age
from 11 to 19 days after pollination, were harvested from
greenhouse-grown plants. Seeds were removed and
separated from pod walls and were immediately frozen in
liquid nitrogen. Seeds throughout the age range were
pooled for mRNA extraction. cDNA was prepared from polyA-
enriched RNA. The cDNA was directionally ligated into
the Unizap XR vector from Stratagene and packaged using
Gigapack III Gold packaging extracts. Plasmids containing
cDNA inserts were excised from the recombinant lambda-Zap
phage using Ex-assist helper phage and propogated in
